### **Methodology Statement**

Bowling Green State University/YouGov Survey of Ohio Likely Voters

Survey Research Field Dates: September 18th –27th, 2024

N=1000 Ohio Likely Voters Margin of Error: +/- 3.6%

YouGov interviewed 1080 Ohio registered voters, with the goal of screening for and surveying likely voters. These Ohio registered voters were then matched down to a sample of 1010, yielding a target subsample of 1000 Ohio likely voters. The respondents were matched to a sampling frame on gender, age, race, and education. The sampling frame is a politically representative "modeled frame" of US adults, based upon the American Community Survey (ACS) public use microdata file, public voter file records, the 2020 Current Population Survey (CPS) Voting and Registration supplements, the 2020 National Election Pool (NEP) exit poll, and the 2020 CES surveys, including demographics and 2020 presidential vote. The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, years of education, and region. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles. The weights were then post-stratified on 2020 presidential vote choice as well as a four-way stratification of gender, age (4-categories), race (4-categories), and education (4-categories). The weighted dataset of Ohio registered voters was then subsetted on likely voters, as determined by response to the question, "Thinking ahead to the presidential election in November, how likely are you to vote?" Upon subsetting to those who answered at least "somewhat likely," the weights were trimmed and recentered around 1, to produce the final weights for Ohio likely voters.
