Marriage Rate in the U.S.: Geographic Variation, 2020
Author: Krista K. Westrick-Payne

This Family Profile, an update of previous profiles on the marriage rate (FP-17-25; FP-18-20; FP-19-22; FP-20-24), estimates adjusted marriage rates for the U.S. and each state for 2020. Please note, the standard 2020 ACS 1-year data products will not be released due to the impact from the COVID-19 pandemic on data collection and data quality (for more information click here). As such, the estimates in this report for the year 2020 were derived from NCFMR analyses of ACS 1-year Experimental PUMS data. We estimate the number of marriages occurring in the last year among unmarried women aged 15 and older and describe geographic variation. Because the standard 1-year estimates were not released, we do not include margins of error in the tables or figures as in prior profiles. For detailed information on the adjusted marriage rate from 2008-2020, see “Charting Marriage & Divorce in the U.S.: The Adjusted Marriage Rate” (Westrick-Payne, 2022).

U.S. Marriage Rate, 2020
- The marriage rate hit a 50-year low in 2020—there were 28.1 marriages per 1,000 unmarried women.
- 2 million women married in 2020, a decrease of about 200,000 marriages from 2019.
- These findings are consistent with administrative reports of fewer marriages in 2020 (Manning & Payne, 2021).

Five Highest and Lowest Marriage Rates, 2020
- Utah once again holds the top spot in terms of the marriage rate with nearly 46 marriages per 1,000 unmarried women in 2020.
- Montana now holds the lowest marriage rate. In 2020, there were about 19 marriages per 1,000 unmarried women in Montana.

State Rankings and Geographic Variation in Marriage Rates, 2020

Figure 3. State-Level Women's Adjusted Marriage Rate by Quartile, 2020

- The states with the highest marriage rates (making up the 4th quartile) in 2020 had rates of at least 31.2 marriages per 1,000 unmarried women aged 15 and older. Among the states in the top quartile, all are substantially above the national average (28.1 marriages per 1,000 unmarried women).
- The states with the lowest marriage rates (making up the 1st quartile) in 2020 had 25.2 or fewer marriages per 1,000 unmarried women.

Figure 4. Geographic Variation of Women’s Adjusted Marriage Rate Among States, 2020

- Most states in the Western region of the country had high marriages rates (3rd or 4th quartile).
  - Exceptions included Montana, New Mexico, California, Hawaii, and Arizona.
- Midwestern states exhibited marriage rates predominately in the middle two quartiles with the largest share found in the second.
  - Ohio was the only midwestern state found in the first quartile.
- Southern states are represented in each quartile. The largest shares were found in the third and fourth.
- Nearly all states in the Northeast exhibited low marriage rates (1st quartile).
  - Exceptions included Pennsylvania (2nd quartile) and Maine (3rd quartile).
