Religiosity, feelings of closeness to a God, and involvement in religious activities, are linked to higher levels of couples’ commitment to one another and marital quality (Dollahite & Lambert, 2007). In long-term couples they are associated with a reduced likelihood of divorce (Dollahite & Lambert, 2007; Tuttle & Davis, 2015). A growing number of older adults are currently unmarried due to increasing shares experiencing a gray divorce (Brown & Lin, 2022, 2012) or never marrying (Lin & Brown, 2012), demonstrating the need to explore the heterogeneity in church attendance and religious attitudes among the unmarried. Using the 2016 wave of the Health and Retirement Study (HRS), this family profile examines religious service attendance and religious attitudes by marital status among adults aged 65 and older, distinguishing between women and men.

Religious Service Attendance Among Women by Marital Status

- About half of married women aged 65 and older reported they attended religious services at least once a week, a level which exceeded that of all unmarried women.
- Following married women, 47% of widowed women and 43% of never married women report that they attended religious services once or more than once a week.
- Older divorced women reported the lowest frequency of weekly religious service attendance at 35%.

Religious Service Attendance Among Men by Marital Status

- Men aged 65 and older tended to have lower weekly religious service attendance than women aged 65 and older across all marital statuses.
- 42% of never married men reported they attended religious services at least once a week, followed by married men (39%) and widowed men (30%).
- Like women, divorced men aged 65 and older had the lowest percentage of weekly religious service attendance (16%), with the level for divorced men roughly half that of divorced women.
Religious Beliefs Among Women by Marital Status

- The percentage of older women who somewhat agreed or strongly agreed that they carry their religious beliefs with them daily was higher than the percentage of older women that reported at least weekly religious service attendance across all marital statuses.
- 78% of widowed women aged 65 and older reported they carry their religious beliefs with them daily, followed by married women and never married women (73%).
- In line with religious service attendance, divorced women aged 65 and older (72%) reported lower importance of religious beliefs in their daily lives than women of other marital statuses.

Religious Beliefs Among Men by Marital Status

- Men aged 65 and older tended to report lower importance of religious beliefs in their daily lives than women aged 65 and older across all marital statuses.
- Like women, widowed men aged 65 and older had the highest percentage (72%), followed by married and divorced men (64%).
- Never married men (48%) reported the lowest importance of religious beliefs in their daily lives.
